

INTRODUCTION TO SYNTAX I

Session 1: Language has (hierarchical) structure

Timea Szarvas

University of Potsdam

`timea.szarvas@uni-potsdam.de`

July 27th 2026

OVA 2026

QUICK ROUND OF INTRODUCTIONS

- What's your name?
- What's your native language?
- Rate your knowledge of formal syntax:

TODAY'S PLAN

- ◉ The role of syntax in the language faculty
- ◉ What makes the syntax we do formal?
- ◉ Basic building blocks
- ◉ Hierarchy
- ◉ Terminology and ways to represent hierarchical structure

■ What happens when we use language to communicate?

■ What happens when we use language to communicate?

- ⊙ We wrap up our thoughts into linguistic utterances to convey them
- ⊙ We unwrap linguistic utterances to understand the thoughts behind them

■ What happens when we use language to communicate?

- ⊙ We wrap up our thoughts into linguistic utterances to convey them
- ⊙ We unwrap linguistic utterances to understand the thoughts behind them

■ How do we do that?

■ What happens when we use language to communicate?

- ⊙ We wrap up our thoughts into linguistic utterances to convey them
- ⊙ We unwrap linguistic utterances to understand the thoughts behind them

■ How do we do that?

- ⊙ By following a set of rules: form-meaning relations are not arbitrary
- ⊙ We obey these rules effortlessly and in real time (at least in our native language)

■ Following the rules of your native language

- ⊙ We do not think about these rules or have the ability to state them explicitly

¹We indicate ungrammaticality by using an asterisk (*)

■ Following the rules of your native language

- ⊙ We do not think about these rules or have the ability to state them explicitly
- ⊙ A speaker of English knows *that* (1b) is ill-formed, but cannot explain *why*:¹

- (1) a. Sarah is incredibly difficult to please.
b. *Sarah is incredibly difficult to be pleased.

¹We indicate ungrammaticality by using an asterisk (*)

■ Following the rules of your native language

- ⊙ We do not think about these rules or have the ability to state them explicitly
- ⊙ A speaker of English knows *that* (1b) is ill-formed, but cannot explain *why*:¹

- (1) a. Sarah is incredibly difficult to please.
b. *Sarah is incredibly difficult to be pleased.

⇒ *Tacit knowledge*: complete, permanent, implicit, not consciously acquired

¹We indicate ungrammaticality by using an asterisk (*)

■ Following the rules of your native language

- ◉ We do not think about these rules or have the ability to state them explicitly
- ◉ A speaker of English knows *that* (1b) is ill-formed, but cannot explain *why*:¹

- (1) a. Sarah is incredibly difficult to please.
b. *Sarah is incredibly difficult to be pleased.

⇒ *Tacit knowledge*: complete, permanent, implicit, not consciously acquired

■ The goal of formal linguistics

- ◉ Make this tacit knowledge explicit to come up with a theoretical model of it.

¹We indicate ungrammaticality by using an asterisk (*)

LANGUAGE FACULTY: Y-MODEL

LANGUAGE FACULTY: Y-MODEL

Mental lexicon

■ **Mental lexicon**

Contains all functional and lexical elements of the language L.

LANGUAGE FACULTY: Y-MODEL

Mental lexicon

Numeration
[likes, Mia, cats]

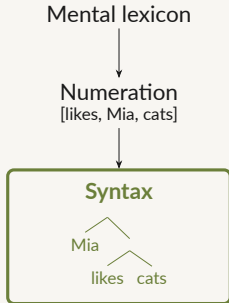

■ Mental lexicon

Contains all functional and lexical elements of the language L.

■ Numeration

Contains functional and lexical elements selected from the mental lexicon for the current derivation.

LANGUAGE FACULTY: Y-MODEL

■ Mental lexicon

Contains all functional and lexical elements of the language L.

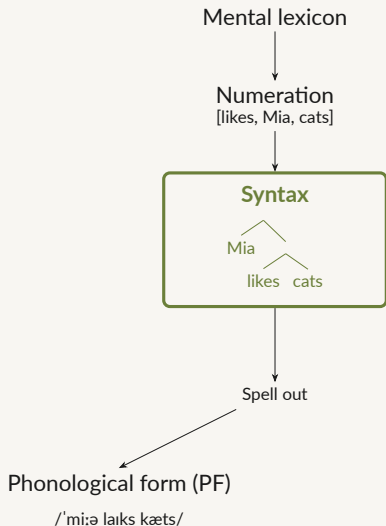

■ Numeration

Contains functional and lexical elements selected from the mental lexicon for the current derivation.

■ Syntax

The computational system combining the elements from the Numeration into complex structures (phrases, sentences).

LANGUAGE FACULTY: Y-MODEL

■ Mental lexicon

Contains all functional and lexical elements of the language L.

■ Numeration

Contains functional and lexical elements selected from the mental lexicon for the current derivation.

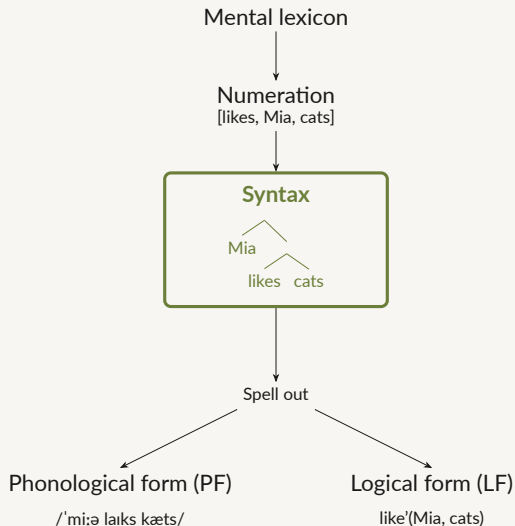

■ Syntax

The computational system combining the elements from the Numeration into complex structures (phrases, sentences).

■ Phonological form

Determines phonetic interpretation.

LANGUAGE FACULTY: Y-MODEL

■ Mental lexicon

Contains all functional and lexical elements of the language L.

■ Numeration

Contains functional and lexical elements selected from the mental lexicon for the current derivation.

■ Syntax

The computational system combining the elements from the Numeration into complex structures (phrases, sentences).

■ Phonological form

Determines phonetic interpretation.

■ Logical form

Determines semantic interpretation.

WELCOME TO SYNTAX!

- Syntax is the computational component of mental grammar.

WELCOME TO SYNTAX!

■ Syntax is the computational component of mental grammar.

- ① **Creativity** – the number of complex structures that can be formed is infinite.
- ② **Restrictiveness** – the manner in which complex structures are formed is non-arbitrary.

WELCOME TO SYNTAX!

■ Syntax is the computational component of mental grammar.

- ① **Creativity** – the number of complex structures that can be formed is infinite.
- ② **Restrictiveness** – the manner in which complex structures are formed is non-arbitrary.

■ Syntax is generative.

- ⊙ Using a **finite vocabulary** and a **finite set of rules**, syntax is capable of generating an **infinite number of complex structures**.

WELCOME TO SYNTAX!

■ Syntax is the computational component of mental grammar.

- ① **Creativity** – the number of complex structures that can be formed is infinite.
- ② **Restrictiveness** – the manner in which complex structures are formed is non-arbitrary.

■ Syntax is generative.

- ⊙ Using a **finite vocabulary** and a **finite set of rules**, syntax is capable of generating an **infinite number of complex structures**.

■ Central questions:

- ⊙ What are the smallest building blocks from which linguistic structures can be formed?
- ⊙ What are the rules that determine how these building blocks are combined?
- ⊙ How are these rules ordered? To what extent do these rules vary cross-linguistically?

■ Natural languages are diverse.

- ⊙ All possible orders of S(ubject), V(erb) and O(bject) are attested:

■ Natural languages are diverse.

- ◉ All possible orders of S(ubject), V(erb) and O(bject) are attested:
- ◉ **SOV**: Turkish (Turkic)
- ◉ **SVO**: BCMS^a (Slavic)
- ◉ **VSO**: Irish (Celtic)
- ◉ **VOS**: Malagasy (Malayo-Polynesian)
- ◉ **OVS**: Urarina (isolate, Peru)
- ◉ **OSV**: Warao (isolate, Venezuela)

^aBosnian-Croatian-Montenegrin-Serbian

■ Natural languages are diverse.

- All possible orders of S(ubject), V(erb) and O(bject) are attested:
- **SOV**: Turkish (Turkic)
- **SVO**: BCMS^a (Slavic)
- **VSO**: Irish (Celtic)
- **VOS**: Malagasy (Malayo-Polynesian)
- **OVS**: Urarina (isolate, Peru)
- **OSV**: Warao (isolate, Venezuela)

^aBosnian-Croatian-Montenegrin-Serbian

⇒ There is no general rule in syntax prohibiting either of these orders — which order is dominant is acquired on a language-by-language basis.

■ Some languages do not have a dominant word order at all, like Hungarian (Ugric)!

- (2) Anyu el-mond-ott egy vicc-et.
mom PV-tell-PST a joke-ACC
S V O
'Mom told a joke.'

CROSS-LINGUISTIC VARIABILITY

(2) Anyu el-mond-ott egy vicc-et.
mom PV-tell-PST a joke-ACC
S V O
'Mom told a joke.'

(3) a. Anyu egy viccet elmondott.
S O V
b. Egy viccet elmondott anyu.
O V S

(4) a. Egy viccet anyu elmondott.
O S V
b. Elmondott anyu egy viccet.
V S O
c. Elmondott egy viccet anyu.
V O S

- ⊙ 'No dominant word order' does not mean that the orders are interchangeable in every context – it means that they are equally acceptable and meaningful in the language.
- ⊙ The notation in the second row of (2) is called the *glossing* or the *glosses*. We use them to make linguistics structures legible to anyone regardless of their proficiency of the respective language. The glosses used in this class follow the Leipzig Glossing Rules.

■ Other phenomena are globally restricted.

- ⊙ No language allows questioning an object of a coordinate structure.

■ Other phenomena are globally restricted.

- ⊙ No language allows questioning an object of a coordinate structure.

- (5) a. Betty is reading Nietzsche.
b. What is Betty reading ____ ?
c. Betty is reading [Nietzsche and Kant].

■ Other phenomena are globally restricted.

- ⊙ No language allows questioning an object of a coordinate structure.

- (5) a. Betty is reading Nietzsche.
b. What is Betty reading ____ ?
c. Betty is reading [Nietzsche and Kant].
d. *What is Betty reading [Nietzsche and ____]?

Other phenomena are globally restricted.

- No language allows questioning an object of a coordinate structure.

- (5)
- a. Betty is reading Nietzsche.
 - b. What is Betty reading ____ ?
 - c. Betty is reading [Nietzsche and Kant].
 - d. *What is Betty reading [Nietzsche and ____]?

(6) *Hungarian*

*Mi-t olvas Betti [Nietzsche-t és ____]?

what-ACC reads Betti Nietzsche-ACC and

Intended: Which x is such that Betty is reading Nietzsche and x?

Try (5d) in your native language — awful, right?

■ How do we uncover syntactic rules if speakers are unable to state them?

- ⊙ Directly observable data (language that is spontaneously produced), only tell us what *is* possible (e.g. freedom of Hungarian word order), but they do not reveal what *is not* (e.g. coordinate structure constraint in (5) and (6))

■ How do we uncover syntactic rules if speakers are unable to state them?

- ⊙ Directly observable data (language that is spontaneously produced), only tell us what *is* possible (e.g. freedom of Hungarian word order), but they do not reveal what *is not* (e.g. coordinate structure constraint in (5) and (6))
- ⇒ A structure that rarely occurs is not necessarily impossible:

■ How do we uncover syntactic rules if speakers are unable to state them?

- ⊙ Directly observable data (language that is spontaneously produced), only tell us what is possible (e.g. freedom of Hungarian word order), but they do not reveal what is *not* (e.g. coordinate structure constraint in (5) and (6))

⇒ A structure that rarely occurs is not necessarily impossible:

(7) Which paper did the editor reject ____ without reading ____ pg?

- ⊙ So called **parasitic gaps** are infrequent, yet most speakers find them quite good (in English).

I How do we uncover syntactic rules if speakers are unable to state them?

- ◉ Directly observable data (language that is spontaneously produced), only tell us what is possible (e.g. freedom of Hungarian word order), but they do not reveal what is *not* (e.g. coordinate structure constraint in (5) and (6))

⇒ A structure that rarely occurs is not necessarily impossible:

(7) Which paper did the editor reject ____ without reading ____ pg?

- ◉ So called **parasitic gaps** are infrequent, yet most speakers find them quite good (in English).
- ◉ Negative evidence is crucial – data showing that something is not possible (recall how bad those questions formed from coordinate structures were in (5d) and (6)!)

■ **Solution: Collect judgments about what is and isn't possible.**

- (8) a. *What is Betty reading Nietzsche and ____ ?
b. *Who did you invite Hannah and ____ ?
c. *Which advanced class would Sam skip the intro and ____ ?

■ **Solution: Collect judgments about what is and isn't possible.**

- (8) a. *What is Betty reading Nietzsche and ____ ?
b. *Who did you invite Hannah and ____ ?
c. *Which advanced class would Sam skip the intro and ____ ?

■ **Stability of judgments**

- ⊙ No matter which words we plug into the sentence and no matter which speaker we ask, questioning an object from a coordinate structure is impossible.

I Observation:

- ⊙ Recognize **regularities** in linguistic data and **formulate hypotheses**
- ⇒ *Questioning objects from coordinate structures is bad.*

BUILDING A THEORETICAL MODEL

I Observation:

- ⊙ Recognize **regularities** in linguistic data and **formulate hypotheses**

⇒ *Questioning objects from coordinate structures is bad.*

I Formalization:

- ⊙ **Construct a model** implementing regularities and hypotheses you observed

⇒ *Coordinate Structure Constraint:*

No conjunct or element from it may be *extracted* (= questioned).

BUILDING A THEORETICAL MODEL

I Observation:

- ⊙ Recognize **regularities** in linguistic data and **formulate hypotheses**
- ⇒ *Questioning objects from coordinate structures is bad.*

I Formalization:

- ⊙ **Construct a model** implementing regularities and hypotheses you observed
- ⇒ *Coordinate Structure Constraint:*
No conjunct or element from it may be *extracted* (= questioned).

I Testing:

- ⊙ Test whether the **empirical predictions** are correct
- ⇒ *Is questioning an object from any part of a coordination bad across languages?*

A NOTE ON THEORETICAL MODELS

*“Scientists also make golems.² Our golems rarely have physical form, but they too are often made of clay, living in silicon as computer code. These golems are scientific models. But these golems have real effects on the world, through the predictions they make and the intuitions they challenge or inspire. A concern with ‘truth’ enlivens these models, but just like a golem or a modern robot, scientific models are neither true nor false, neither prophets nor charlatans. **Rather they are constructs engineered for some purpose.**”* (McElreath 2020)

■ **Purpose of syntactic model $\Rightarrow$ help us understand the structure of human language.**

²An animated, artificial human figure made from inanimate matter, such as clay or mud, originating in Jewish folklore.

A NOTE ON THEORETICAL MODELS

- Models attempt to depict the observed reality as accurately and simply as possible.
 - ⊙ Models are **never 'true'!** But they can be accurate/powerful/beautiful/elegant.

A NOTE ON THEORETICAL MODELS

- Models attempt to depict the observed reality as accurately and simply as possible.

- ⊙ Models are **never 'true'!** But they can be accurate/powerful/beautiful/elegant.

- Models should...

- ⇒ **be falsifiable:** the model can be tested and, given sufficient evidence, refuted;

A NOTE ON THEORETICAL MODELS

■ Models attempt to depict the observed reality as accurately and simply as possible.

- ⊙ Models are **never 'true'!** But they can be accurate/powerful/beautiful/elegant.

■ Models should...

- ⇒ **be falsifiable:** the model can be tested and, given sufficient evidence, refuted;
- ⇒ **generate predictions:** the model should predict the expected outcome in a previously unobserved situation under specific circumstances;

A NOTE ON THEORETICAL MODELS

■ Models attempt to depict the observed reality as accurately and simply as possible.

- ⊙ Models are **never 'true'!** But they can be accurate/powerful/beautiful/elegant.

■ Models should...

- ⇒ **be falsifiable:** the model can be tested and, given sufficient evidence, refuted;
- ⇒ **generate predictions:** the model should predict the expected outcome in a previously unobserved situation under specific circumstances;
- ⇒ **be simple:** the model makes as few assumptions as possible.

A NOTE ON THEORETICAL MODELS

■ Models attempt to depict the observed reality as accurately and simply as possible.

- ⊙ Models are **never 'true'!** But they can be accurate/powerful/beautiful/elegant.

■ Models should...

- ⇒ **be falsifiable:** the model can be tested and, given sufficient evidence, refuted;
- ⇒ **generate predictions:** the model should predict the expected outcome in a previously unobserved situation under specific circumstances;
- ⇒ **be simple:** the model makes as few assumptions as possible.

■ What you learn about in this class is a particular theoretical model of human syntax.

- ⊙ It is called Minimalism (based on the minimalist program by Chomsky 1995).
- ⊙ I draw some inspiration from David Adger's 2003 book *Core Syntax* (Adger 2003).

■ Testing whether the empirical predictions are correct:

⇒ *Is questioning an object from any part of a coordination bad across languages?*

- (9) a. Betty is reading Nietzsche and Tom is citing Kant.
b. *What is Betty reading Nietzsche and Tom citing ____ ?

■ Testing whether the empirical predictions are correct:

⇒ *Is questioning an object from any part of a coordination bad across languages?*

- (9) a. Betty is reading Nietzsche and Tom is citing Kant.
b. *What is Betty reading Nietzsche and Tom citing ____ ?
c. *What is Betty reading ____ and Tom citing Kant?

■ Testing whether the empirical predictions are correct:

⇒ *Is questioning an object from any part of a coordination bad across languages?*

- (9) a. Betty is reading Nietzsche and Tom is citing Kant.
b. *What is Betty reading Nietzsche and Tom citing ____ ?
c. *What is Betty reading ____ and Tom citing Kant?
d. What is Betty reading ____ and Tom citing ____ ?

BUILDING A THEORETICAL MODEL

■ Testing whether the empirical predictions are correct:

⇒ *Is questioning an object from any part of a coordination bad across languages?*

- (9) a. Betty is reading Nietzsche and Tom is citing Kant.
- b. *What is Betty reading Nietzsche and Tom citing ____ ?
- c. *What is Betty reading ____ and Tom citing Kant?
- d. What is Betty reading ____ and Tom citing ____ ?
- e. What is Betty reading ____, Tom citing ____ and Stella studying ____ ?

■ Revision: ATB-rule (ATB = across-the-board, Ross 1967)

- ⊙ Questioning the object of a coordination is bad *unless it affects every conjunct*.

■ Next step: What does the syntactic structure of these sentences look like?

- ⊙ (testing + revision repeated endlessly until our model covers the empirical facts)

(10) *The cats chases the mouse.

(11) ?The mouse that the cat that the dog barked at chased panted.

Both sentences are not quite right. Can you guess why?

(10) *The cats chases the mouse.

(11) ?The mouse that the cat that the dog barked at chased panted.

■ **Both sentences are not quite right. Can you guess why?**

- ⊙ (9) is syntactically ill-formed: our **linguistic competence** tells us that verbs agree with their subjects in English.

(10) *The cats chases the mouse.

(11) ?The mouse that the cat that the dog barked at chased panted.

■ Both sentences are not quite right. Can you guess why?

- ⊙ (9) is syntactically ill-formed: our **linguistic competence** tells us that verbs agree with their subjects in English.
 - ⊙ (10) is syntactically well-formed, but really difficult to understand.
- ⇒ Our **linguistic performance** is failing us! Center embedding is terrible to process.

■ In German, center embedding for relative clauses is optional.

- (12) a. [?]Die Maus, die die Katze, die der Hund anbell-te, jag-te, schnauf-te.
 DET mouse REL DET cat REL DET dog bark.at-PST.3SG hunt-PST.3SG pant-PST.3SG

■ In German, center embedding for relative clauses is optional.

- (12) a. ?Die Maus, die die Katze, die der Hund anbell-te, jag-te, schnauf-te.
DET mouse REL DET cat REL DET dog bark.at-PST.3SG hunt-PST.3SG pant-PST.3SG
- b. Die Maus, die die Katze jag-te, die der Hund anbell-te, schnauf-te.
DET mouse REL DET cat hunt-PST.3SG REL DET dog bark.at-PST.3SG pant-PST.3SG
'The mouse that the cat that the dog barked at chased panted.'

■ In German, center embedding for relative clauses is optional.

- (12) a. [?]Die Maus, die die Katze, die der Hund anbell-te, jag-te, schnauf-te.
DET mouse REL DET cat REL DET dog bark.at-PST.3SG hunt-PST.3SG pant-PST.3SG
- b. Die Maus, die die Katze jag-te, die der Hund anbell-te, schnauf-te.
DET mouse REL DET cat hunt-PST.3SG REL DET dog bark.at-PST.3SG pant-PST.3SG
'The mouse that the cat that the dog barked at chased panted.'

- ⊙ The fact that the syntactically equivalent (11b) is an improvement illustrates that the oddness of (11a) is not due to grammar/competence.

■ In German, center embedding for relative clauses is optional.

- (12) a. ?Die Maus, die die Katze, die der Hund anbell-te, jag-te, schnauf-te.
DET mouse REL DET cat REL DET dog bark.at-PST.3SG hunt-PST.3SG pant-PST.3SG
- b. Die Maus, die die Katze jag-te, die der Hund anbell-te, schnauf-te.
DET mouse REL DET cat hunt-PST.3SG REL DET dog bark.at-PST.3SG pant-PST.3SG
'The mouse that the cat that the dog barked at chased panted.'

⊙ The fact that the syntactically equivalent (11b) is an improvement illustrates that the oddness of (11a) is not due to grammar/competence.

⇒ **Linguistic competence** = the tacit knowledge linguists are interested in.

⇒ **Linguistic performance** = competence in action, limited by general cognitive constraints.

■ Linguistic competence:

- ⊙ The abstract set of rules of a language L that generates grammatical structures.
 - ⊙ Grammaticality is **categorical**: the system only generates grammatical structures.
- ⇒ A complex expression is grammatical or ungrammatical, no in between.

■ Linguistic competence:

- ⊙ The abstract set of rules of a language L that generates grammatical structures.
 - ⊙ Grammaticality is **categorical**: the system only generates grammatical structures.
- ⇒ A complex expression is grammatical or ungrammatical, no in between.

■ Linguistic performance:

- ⊙ The real-life application of linguistic competence.
 - ⊙ Acceptability is **gradient**: numerous factors influence acceptability (plausibility, context, processing ease, prescriptivism, **grammaticality!**)
- ⇒ A complex expression can be more or less acceptable, the nuances are unlimited.

■ Linguistic structures are built from lexical and functional elements.

- ⊙ Intuitively, some building blocks belong together 'more closely' than others.

(13) The mouse that stole the cheese was hiding from the cat in the cabinet.

■ Linguistic structures are built from lexical and functional elements.

- ⊙ Intuitively, some building blocks belong together 'more closely' than others.

(13) The mouse that stole the cheese was hiding from the cat in the cabinet.

- ⊙ Unit: *the mouse that stole the cheese*
- ⊙ Not a unit: *cheese was*

■ Linguistic structures are built from lexical and functional elements.

- ⊙ Intuitively, some building blocks belong together 'more closely' than others.

(13) The mouse that stole the cheese was hiding from the cat in the cabinet.

- ⊙ Unit: *the mouse that stole the cheese*
- ⊙ Not a unit: *cheese was*

■ Such sensible units are called constituents.

■ Linguistic structures are built from lexical and functional elements.

- ◉ Intuitively, some building blocks belong together 'more closely' than others.

(13) The mouse that stole the cheese was hiding from the cat in the cabinet.

- ◉ Unit: *the mouse that stole the cheese*
- ◉ Not a unit: *cheese was*

■ Such sensible units are called constituents.

- ◉ Constituents may consist of multiple words, but each word is also a constituent.
 - ◉ Several grammatical processes affect constituents, not random strings.
- ⇒ We can use these grammatical processes to test whether a string is a constituent!

CONSTITUENCY TESTS

- ① Replacement test $\Rightarrow$ constituents can be replaced
(14) **It** was hiding from the cat in the cabinet.

CONSTITUENCY TESTS

- ① Replacement test $\Rightarrow$ constituents can be replaced

(14) It was hiding from the cat in the cabinet.

- ② Ellipsis test $\Rightarrow$ constituents can be deleted

(15) The mouse that stole the cheese was hiding from the cat $\langle$ in the cabinet $\rangle$.

CONSTITUENCY TESTS

- ① Replacement test $\Rightarrow$ constituents can be replaced

(14) **It** was hiding from the cat in the cabinet.

- ② Ellipsis test $\Rightarrow$ constituents can be deleted

(15) The mouse that stole the cheese was hiding from the cat $\langle$ in the cabinet $\rangle$.

- ③ Movement test (constituents can move within the sentence)

(16) **In the cabinet**, the mouse that stole the cheese was hiding from the cat.

CONSTITUENCY TESTS

- ① Replacement test $\Rightarrow$ constituents can be replaced

(14) **It** was hiding from the cat in the cabinet.

- ② Ellipsis test $\Rightarrow$ constituents can be deleted

(15) The mouse that stole the cheese was hiding from the cat *in the cabinet*.

- ③ Movement test (constituents can move within the sentence)

(16) **In the cabinet**, the mouse that stole the cheese was hiding from the cat.

- ④ Clefting test $\Rightarrow$ a constituent can be clefted (It is/was *constituent* that...)

(17) It was **in the cabinet** that the mouse that stole the cheese was hiding from the cat.

CONSTITUENCY TESTS

- ① Replacement test $\Rightarrow$ constituents can be replaced

(14) **It** was hiding from the cat in the cabinet.

- ② Ellipsis test $\Rightarrow$ constituents can be deleted

(15) The mouse that stole the cheese was hiding from the cat *in the cabinet*.

- ③ Movement test (constituents can move within the sentence)

(16) **In the cabinet**, the mouse that stole the cheese was hiding from the cat.

- ④ Clefting test $\Rightarrow$ a constituent can be clefted (It is/was *constituent* that...)

(17) It was **in the cabinet** that the mouse that stole the cheese was hiding from the cat.

- ⑤ Coordination test $\Rightarrow$ constituents can be coordinated

(18) The mouse that stole the cheese was hiding from **the cat** and **the dog** in the cabinet.

■ **Note: the inference drawn from these tests is unidirectional!**

- ⊙ If a chain α can be replaced/elided/moved/... $\Rightarrow \alpha$ is a constituent.
- ⊙ **NOT:** If a chain α is a constituent, it must be possible to replace/elide/move/...it.

■ Note: the inference drawn from these tests is unidirectional!

- ⊙ If a chain α can be replaced/elided/moved/... $\Rightarrow \alpha$ is a constituent.
- ⊙ **NOT:** If a chain α is a constituent, it must be possible to replace/elide/move/...it.

■ Independent reasons may lead to a failed test.

- ⊙ The tests make use of syntactic operations (movement, ellipsis, coordination) that have their own restrictions and quirks.
- $\Rightarrow$ Always apply as many constituency tests as possible!

STRUCTURE OF CONSTITUENTS

■ We represent constituents using square brackets:

(19) [The mouse [that [stole [the cheese]]] [was [hiding [from [the cat [in [the cabinet]]]]]]]

STRUCTURE OF CONSTITUENTS

■ We represent constituents using square brackets:

(19) [The mouse [that [stole [the cheese]]] [was [hiding [from [the cat [in [the cabinet]]]]]]

■ Sentences/phrases have a hierarchical structure!

- ⊙ Constituents are embedded into one another.
- ⊙ This hierarchical structure exists on an abstract level – we cannot see it or hear it.
- ⊙ But: the overwhelming majority of **syntactic processes target the hierarchical structure of sentences**, not linearly adjacent strings!

EVIDENCE FOR HIERARCHICAL STRUCTURE

■ There is something special about our previous example:

(12) The mouse that stole the cheese was hiding from the cat in the cabinet.

EVIDENCE FOR HIERARCHICAL STRUCTURE

■ There is something special about our previous example:

(12) The mouse that stole the cheese was hiding from the cat in the cabinet.

■ Can you tell what it is?

EVIDENCE FOR HIERARCHICAL STRUCTURE

■ There is something special about our previous example:

(12) The mouse that stole the cheese was hiding from the cat in the cabinet.

■ Can you tell what it is?

- ⊙ (12) is *structurally ambiguous*: there are two possible interpretations!

EVIDENCE FOR HIERARCHICAL STRUCTURE

■ There is something special about our previous example:

(12) The mouse that stole the cheese was hiding from the cat in the cabinet.

■ Can you tell what it is?

⊙ (12) is *structurally ambiguous*: there are two possible interpretations!

(12') The mouse that stole the cheese [was [hiding [from [the cat [in [the cabinet]]]]]]

(12'') The mouse that stole the cheese [was [hiding [from [the cat]] [in the cabinet]]]

EVIDENCE FOR HIERARCHICAL STRUCTURE

There is something special about our previous example:

(12) The mouse that stole the cheese was hiding from the cat in the cabinet.

Can you tell what it is?

- ◉ (12) is *structurally ambiguous*: there are two possible interpretations!

(12') The mouse that stole the cheese [was [hiding [from [the cat [in [the cabinet]]]]]]

(12'') The mouse that stole the cheese [was [hiding [from [the cat]] [in the cabinet]]

- ◉ (12'): *the cat in the cabinet* forms a constituent
- ◉ (12''): *hiding in the cabinet* forms a constituent (without *the cat*)

EVIDENCE FOR HIERARCHICAL STRUCTURE

■ Let's dissect how this argument in favor of hierarchy works.

EVIDENCE FOR HIERARCHICAL STRUCTURE

■ Let's dissect how this argument in favor of hierarchy works.

- ⊙ (12) has one surface form: (12') and (12'') are identical if we ignore the brackets.
 - ⊙ Yet, the sentence has two interpretations, indicating two abstract representations:
- ⇒ (12') and (12'') are **two abstract representations of the same sentence**, (12).

EVIDENCE FOR HIERARCHICAL STRUCTURE

■ Let's dissect how this argument in favor of hierarchy works.

- ⊙ (12) has one surface form: (12') and (12'') are identical if we ignore the brackets.
- ⊙ Yet, the sentence has two interpretations, indicating two abstract representations:
⇒ (12') and (12'') are **two abstract representations of the same sentence**, (12).

■ Recall the Y-model a few slides ago!

- ⊙ Y-model = formalization of the hypothesis that mental grammar is modular

EVIDENCE FOR HIERARCHICAL STRUCTURE

■ Let's dissect how this argument in favor of hierarchy works.

- ⊙ (12) has one surface form: (12') and (12'') are identical if we ignore the brackets.
 - ⊙ Yet, the sentence has two interpretations, indicating two abstract representations:
- ⇒ (12') and (12'') are **two abstract representations of the same sentence**, (12).

■ Recall the Y-model a few slides ago!

- ⊙ Y-model = formalization of the hypothesis that mental grammar is modular
- ⊙ The output of syntax is mapped onto Phonological form (PF) and Logical form (LF).

EVIDENCE FOR HIERARCHICAL STRUCTURE

■ Let's dissect how this argument in favor of hierarchy works.

- ⊙ (12) has one surface form: (12') and (12'') are identical if we ignore the brackets.
 - ⊙ Yet, the sentence has two interpretations, indicating two abstract representations:
- ⇒ (12') and (12'') are **two abstract representations of the same sentence**, (12).

■ Recall the Y-model a few slides ago!

- ⊙ Y-model = formalization of the hypothesis that mental grammar is modular
 - ⊙ The output of syntax is mapped onto Phonological form (PF) and Logical form (LF).
 - ⊙ LF can only work with the input syntax has passed on to it!
- ⇒ **Structural ambiguity = multiple possible LFs = multiple syntactic structures.**

MORE EVIDENCE FOR HIERARCHICAL STRUCTURE

■ Phonological processes are sensitive to constituency, too.

(20) On Tuesdays, he gives the *Chinese dishes*.

MORE EVIDENCE FOR HIERARCHICAL STRUCTURE

■ Phonological processes are sensitive to constituency, too.

(20) On Tuesdays, he gives the *Chinese dishes*.

- a. = He gives the Chinese dishes to someone (not the Italian dishes)
- b. = He gives dishes to Chinese people (not Italian people).

MORE EVIDENCE FOR HIERARCHICAL STRUCTURE

■ Phonological processes are sensitive to constituency, too.

(20) On Tuesdays, he gives the *Chinese dishes*.

- a. = He gives the Chinese dishes to someone (not the Italian dishes)
- b. = He gives dishes to Chinese people (not Italian people).

(21) a. He gives the [**CHInese** DIshes] (to someone).

- b. He gives the [chi**NESE**] [DIshes].

MORE EVIDENCE FOR HIERARCHICAL STRUCTURE

■ Phonological processes are sensitive to constituency, too.

(20) On Tuesdays, he gives the *Chinese dishes*.

- a. = He gives the Chinese dishes to someone (not the Italian dishes)
- b. = He gives dishes to Chinese people (not Italian people).

(21) a. He gives the [**CH**inese Dishes] (to someone).

b. He gives the [chi**NESE**] [Dishes].

■ This argument has the same logic as the one we saw before.

- ⊙ When *Chinese dishes* forms a constituent, stress shifts (*chiNESE* $\Rightarrow$ *CH*inese)!
- ⊙ PF can only work with the input syntax has passed on to it.
- ⊙ **Multiple PFs = multiple syntactic structures.**

I Putting the *formal* in *formal syntax*

- ⊙ Formal theories/models/hypotheses have well-defined mathematical properties.
- ⇒ If their statements are **explicit and clearly defined**, misusing them becomes hard.

I Putting the *formal* in *formal syntax*

- ⊙ Formal theories/models/hypotheses have well-defined mathematical properties.
- ⇒ If their statements are **explicit and clearly defined**, misusing them becomes hard.
- ⊙ Formalization ensures that if a person refers to x , another person will be able to grasp what they mean regardless of their situation, identity or views.

HIERARCHY AND TREES IN MATHEMATICS

■ Putting the *formal* in *formal syntax*

- ◉ Formal theories/models/hypotheses have well-defined mathematical properties.
- ⇒ If their statements are **explicit and clearly defined**, misusing them becomes hard.
- ◉ Formalization ensures that if a person refers to x , another person will be able to grasp what they mean regardless of their situation, identity or views.

■ Borrowing representations from mathematics

- ◉ We already formalized the structure of a sentence by adding brackets:

(12') The mouse that stole the cheese was hiding from [the cat [in [the cabinet]]]

(22) $4 + [6 \times 2]$

I Borrowing more representations from mathematics

- ⊙ Syntax is all about trees — but where do these trees actually come from?

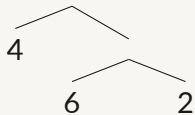

I Borrowing more representations from mathematics

- ⊙ Syntax is all about trees — but where do these trees actually come from?
- ⊙ So far, we used brackets to indicate constituency and ‘closeness’.
- ⊙ An alternative way to represent this closeness relation is to use a **tree graph**:

■ Borrowing more representations from mathematics

- ◉ Syntax is all about trees — but where do these trees actually come from?
- ◉ So far, we used brackets to indicate constituency and ‘closeness’.
- ◉ An alternative way to represent this closeness relation is to use a **tree graph**:

(23) $4 + [6 \times 2]$

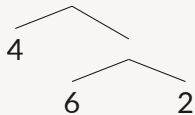

HIERARCHY AND TREES IN MATHEMATICS

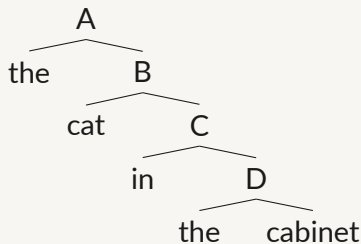

Borrowing more representations from mathematics

- Syntax is all about trees – but where do these trees actually come from?
- So far, we used brackets to indicate constituency and ‘closeness’.
- An alternative way to represent this closeness relation is to use a **tree graph**:

(23) $4 + [6 \times 2]$

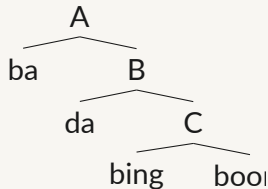

(24) [the cat [in [the cabinet]]]

LET'S TALK ABOUT TREES!

Terms denoting parts of/relations within a tree:

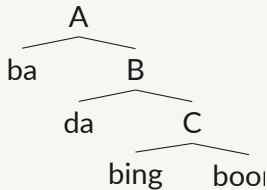

- Nodes: A, B, C, *ba*, *da*, *bing*, *boom*

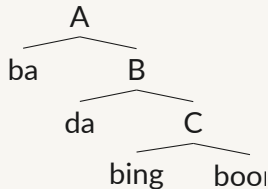

LET'S TALK ABOUT TREES!

Terms denoting parts of/relations within a tree:

- ◉ **Nodes:** *A, B, C, ba, da, bing, boom*
- ◉ **Terminal nodes:** *ba, da, bing, boom*

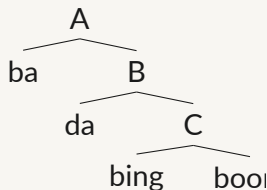

LET'S TALK ABOUT TREES!

Terms denoting parts of/relations within a tree:

- ◉ **Nodes:** A, B, C, *ba*, *da*, *bing*, *boom*
- ◉ **Terminal nodes:** *ba*, *da*, *bing*, *boom*
- ◉ **Root:** A

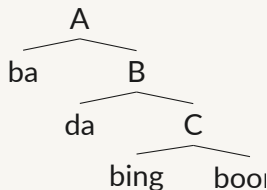

LET'S TALK ABOUT TREES!

Terms denoting parts of/relations within a tree:

- ◉ **Nodes:** A, B, C, *ba*, *da*, *bing*, *boom*
- ◉ **Terminal nodes:** *ba*, *da*, *bing*, *boom*
- ◉ **Root:** A
- ◉ **Dominance:** A dominates *ba*, B and everything dominated by B (B dominates *da*, C and everything dominated by C, C dominates *bing* and *boom*)

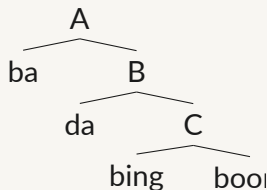

LET'S TALK ABOUT TREES!

Terms denoting parts of/reasons within a tree:

- ◉ **Nodes:** A, B, C, *ba*, *da*, *bing*, *boom*
- ◉ **Terminal nodes:** *ba*, *da*, *bing*, *boom*
- ◉ **Root:** A
- ◉ **Dominance:** A dominates *ba*, B and everything dominated by B (B dominates *da*, C and everything dominated by C, C dominates *bing* and *boom*)
- ◉ **Immediate dominance:** A immediately dominates *ba* and B but not *da*, C, *bing* and *boom*

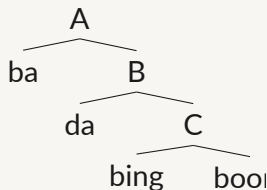

LET'S TALK ABOUT TREES!

Terms denoting parts of/reasons within a tree:

- ◉ **Nodes:** A, B, C, *ba*, *da*, *bing*, *boom*
- ◉ **Terminal nodes:** *ba*, *da*, *bing*, *boom*
- ◉ **Root:** A
- ◉ **Dominance:** A dominates *ba*, B and everything dominated by B (B dominates *da*, C and everything dominated by C, C dominates *bing* and *boom*)
- ◉ **Immediate dominance:** A immediately dominates *ba* and B but not *da*, C, *bing* and *boom*
- ◉ **Motherhood:** A is the mother of *ba* and B, B is the mother of *da* and C, C is the mother of *bing* and *boom*

LET'S TALK ABOUT TREES!

Terms denoting parts of/relations within a tree:

- ◉ **Nodes:** A, B, C, *ba*, *da*, *bing*, *boom*
- ◉ **Terminal nodes:** *ba*, *da*, *bing*, *boom*
- ◉ **Root:** A
- ◉ **Dominance:** A dominates *ba*, B and everything dominated by B (B dominates *da*, C and everything dominated by C, C dominates *bing* and *boom*)
- ◉ **Immediate dominance:** A immediately dominates *ba* and B but not *da*, C, *bing* and *boom*
- ◉ **Motherhood:** A is the mother of *ba* and B, B is the mother of *da* and C, C is the mother of *bing* and *boom*
- ◉ **Sisterhood:** *ba* and B, *da* and C, *bing* and *boom* are sisters

■ Some useful definitions to return to if you feel lost:

- ◉ **Node:** represents a constituent of a tree
- ◉ **Branch:** connects the nodes of a tree
- ◉ **Terminal node:** a node that does not branch any further
- ◉ **Path:** continuous sequence of nodes and branches that connects two nodes
- ◉ **Root:** the topmost node dominating all other nodes
- ◉ **Dominance:** node α dominates node β iff³ α is higher up the tree than β such that you can trace a line from α to β going only downwards.
- ◉ **Immediate dominance:** node α immediately dominates node β iff it is the closest node that dominates β .
- ◉ **Motherhood:** node α is the mother of node β iff it immediately dominates β (node β is the daughter of node α).
- ◉ **Sisterhood:** nodes β and γ are sisters iff node α is the mother of β and γ .

³if and only if
